The time period for reply, if any, is set in the attached communication.

Office Action Summary

Application No.

09/505,951

Applicant(s)

WALMSLEY ET AL.

Examiner

Zachary A. Davis

Art Unit

2137

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 02 April 2008.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1, 2, 4, 5, 7-14 and 16-20 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1, 2, 4, 5, 7-14 and 16-20 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO/SB/C)
- Paper No(s)/Mail Date 20080128
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

DETAILED ACTION

1. A response was received on 02 April 2008. By this response, Claims 1, 2, 4, 7-9, 11, 12, and 17-19 have been amended. No claims have been added or canceled. Claims 1, 2, 4, 5, 7-14, and 16-20 are currently pending in the present application.

Response to Amendment

2. The present response does not fully comply with the provisions of 37 CFR 1.121. In particular, Claim 5 does not appear to be labeled with the correct status identifier as required by 37 CFR 1.121(c). Although the claim is listed as (Currently Amended), there do not appear to be any amendments to the claim shown by the required markings, and therefore, it appears that the claim should have been listed as (Previously Presented). However, because the present reply appears to be a *bona fide* attempt to advance the prosecution of the present application, the reply has been considered as though it were fully compliant with the provisions of 37 CFR 1.121(c).

Response to Arguments

3. Applicant's arguments with respect to claim 1 have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 112

4. The rejection of Claims 1, 2, 4, 5, 7-14, and 16-20 under 35 U.S.C. 112, second paragraph, as indefinite is withdrawn in light of the amendments to the claims.

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. Claims 1, 2, 4, 5, 7-14, and 16-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Carmon et al, WIPO Publication WO99/10180, in view of Sony Corporation (Kusakabe), European Patent EP 0817420, Spies et al, US Patent 5689565, Goto, US Patent 5617429, Sibert, US Patent 7243236, and Schneier, *Applied Cryptography*.

In reference to Claim 1, Carmon discloses a validation protocol for determining authenticity of a printer consumable (page 4, line 20-page 5, line 10) including the steps of providing a printer containing a first authentication chip and a printer consumable containing an second authentication chip (page 11, line 20-page 12, line 2); generating and encrypting a random number in the first authentication chip (page 12, lines 8-12); encrypting the random number in the second authentication chip (page 12, lines 9-11);

and comparing the two encrypted random numbers, where if the two encrypted numbers match, then the second chip is considered to be valid and use of the consumable is authorized, or else the second chip is considered to be invalid and use of the consumable is denied (page 12, lines 13-15; see also page 11, lines 10-12). However, Carmon does not explicitly disclose encryption with two different keys.

Sony discloses an authentication method (see Figures 7- 9, Claim 1, and column 2, line 49-column 3, line 17) in which a random number is generated by a random function (column 8, lines 12-17) and encrypted with a symmetric encryption function using a first key in a first apparatus (column 9, lines 13-17). The encrypted random number is sent to a second apparatus (column 9, lines 18-21) and decrypted with a symmetric decryption function using the first key (column 9, lines 31-37), and then encrypted with the symmetric encryption function using a second key (column 9, lines 41-48) and sent to the first apparatus (column 9, line 57-column 10, line 2). The encrypted random number is compared with the originally encrypted random number (column 10, lines 29-31) after first being decrypted with the symmetric decryption function using the second key (column 10, lines 21-28). The two numbers matching authenticates the second apparatus (column 10, lines 31-35) and the two numbers not matching does not authenticate the second apparatus (column 10, lines 36-39). Therefore, it would have been obvious to modify the protocol of Carmon to use the specifics of the method taught by Sony, in order to authenticate an untrusted device as an authorized party for communication (see Sony, column 10, lines 31-35; column 14, lines 12-15; see also column 1, line 57-column 2, line 48).

Further, neither Carmon nor Sony discloses the calculation and comparison of a digital signature as a step of the authentication method. Spies discloses a cryptographic system and method that includes generating a digital signature of a document (column 12, lines 6-13) and encrypting the document and digital signature under the same symmetric encryption key in a sending device (column 12, lines 14-27, noting especially the equation at line 25). Spies further discloses decrypting the document and signature at a receiving device (column 13, lines 15-22) and verifying the signature (column 13, lines 20-36). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method of Carmon and Sony by including the steps of generating a digital signature of the random number (the "document") and encrypting the signature with the random number in the first apparatus, and of decrypting and verifying the signature in the second apparatus, in order to authenticate the sending of the random number (see Spies, column 13, lines 26-32) and more generally to allow for greater security, privacy, authenticity, and integrity in the system (see Spies, column 2, lines 1-4).

Additionally, although Carmon, Sony, and Spies disclose encrypting the random number in the first chip and comparing the encrypted number with the second number (as above, at least Sony, column 9, lines 41-48, column 9, line 57-column 10, line 2, and column 10, lines 21-39), none of Sony, Carmon, and Spies explicitly discloses calling a function using a first number such that a comparison never returns a match. Goto discloses a method in which a wrong expected value is passed to a function in order to force the function to output an error result (see column 16, lines 21-58,

especially lines 42-58). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method of Carmon, Sony, and Spies by including the option of sending an intentionally wrong value in order to increase reliability by verifying that the system can properly detect an error (see Goto, column 16, lines 14-20).

Still further, although Carmon, Sony, Spies and Goto disclose passing an incorrect expected value to a function in order to force the function to output an error result (as above, Goto, column 16, lines 21-58) and encrypting the random number in the first chip and comparing the encrypted number with the second number (as above, at least Sony, column 9, lines 41-48, column 9, line 57-column 10, line 2, and column 10, lines 21-39), none of Carmon, Sony, Spies, and Goto explicitly discloses making a plural and random number of comparisons with the intentionally incorrect value before comparing the encrypted number with the second number. Sibert discloses a method in which testing steps are repeated a random number of times in order to provide a reasonable probability that the application responding to the tests has not been modified (column 25, lines 13-40, especially lines 30-35; see also Figure 22A). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method of Carmon, Sony, Spies, and Goto to include performing the tests with the intentionally incorrect values a random number of times in order to provide a reasonable probability that the application has not been modified (Sibert, column 25, lines 30-35) and to help protect against inauthentic modules (see Sibert, column 4, lines 17-57).

Yet further, although Carmon, Sony, Spies, Goto, and Sibert disclose the use of various random numbers (see various portions as cited above), none of Carmon, Sony, Spies, Goto, and Sibert explicitly discloses determining any of the random numbers, and particularly the plural and random number of times, based on a clock signal. Schneier discloses the use of a clock signal in the generation of random numbers (pages 421-428, section 17.14, "Real Random-Sequence Generators", and particularly page 424, "Using the Computer's Clock"). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to use this method of generating the plural and random number, in order to increase the security and randomness of the numbers (see Schneier, pages 421-422, section 17.14, first paragraph, where real random numbers are more secure than pseudo-random numbers).

In reference to Claim 2, Carmon as modified above further discloses that the first and second keys are held in both the first and second chips (see Sony, Figure 9).

In reference to Claim 4, Carmon as modified above further discloses that the second chip holds a decryption function (see Sony, column 9, lines 31-37).

In reference to Claim 5, Carmon as modified above further discloses that hash functions can be used in the creation of digital signatures, and specifically discloses the use of 160 bit hashes (Schneier, page 38, last paragraph).

In reference to Claim 7, Carmon as modified above further discloses that the second chip monitors the time elapsed between steps of its processing (see Sony, column 10, lines 53-56).

In reference to Claim 8, Carmon as modified above further discloses that the test function generating the random numbers is held in the first chip (see Sony, column 8, lines 12-15). Additionally, Carmon as modified above discloses that if the second chip is not authenticated, the authentication process is terminated (Sony, column 10, lines 36-39).

In reference to Claim 9, Carmon as modified above further discloses that the first chip monitors the time elapsed between steps of its processing (see Sony, column 10, lines 6-7).

In reference to Claim 10, Carmon as modified above further discloses that it is determined if the second chip is valid (Carmon, page 12, lines 13-15; see also Sony, column 10, lines 31-35) or not (Carmon, page 12, lines 13-15, and page 11, lines 10-12; Sony, column 10, lines 36-39).

Claims 11-14 and 16-20 are system claims reciting limitations corresponding substantially to those of the methods of Claims 1, 2, 4, 5, and 7-10, and are thus rejected by a similar rationale.

Conclusion

7. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

- a. Menezes et al, *Handbook of Applied Cryptography* (previously cited), discloses the generation of random numbers based on a clock signal.

8. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP

§ 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Zachary A. Davis whose telephone number is (571)272-3870. The examiner can normally be reached on weekdays 8:30-6:00, alternate Fridays off.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Emmanuel Moise can be reached on (571) 272-3865. The fax phone
